

INTRODUCING

SRL
SELF REPAIRING LAWN

We all enjoy the look and feel of a well grown lawn. They have a magnetism for kids who instinctively run around on them, adults lay about relaxing on them and they are a big part of our family lifestyles. But with this traffic comes damage and deterioration. The bare patches that show up from football, bikes, pets and garden parties are simply, best avoided. All they are is cost and effort disguised as an unsightly exposed bit of soil.

CREEPING · SPREADING
SELF REPAIRING LAWN

Because Self Repairing Lawn spends its time growing sideways rather than tall and shaggy it requires less mowing, about half the mowing of some family rye and fescue lawns. And with its short tight growth habit the lawn keeps its good looks between mows. Combine these labour savings with its beautiful fine texture, great colour and you are growing the ultimate family lawn.

- **SRL** is a new Innovation for your home lawn
- **SRL** spreads via reproductive tillers
- **SRL** is able to repair damaged lawn
- **SRL** has Unsurpassed density
- **SRL** is extremely fine textured

SRL SELF REPAIRING **LAWN**

Self Repairing Lawn is a new innovative family lawn seed that does exactly as its name suggests. Its success is its ability to grow and spread sideways through damaged lawn and over bare patches, repairing as it grows. Normal rye grass lawns never repair in fact the bare patches attract weed seed and we all know what happens next.

Damage trial – extreme damage.

SELF **R**EPAIRING **L**AWN

**Normal turf type
ryegrass –
about 125 mm**

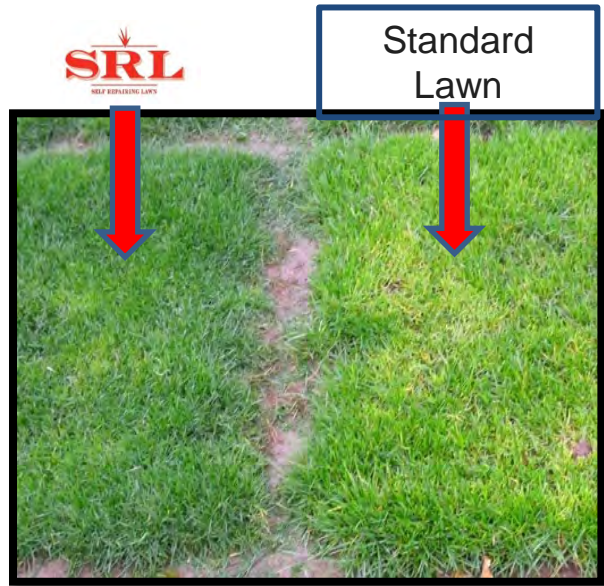

**SRL –
about 75 mm**

SRL in trials showed 40% less “top growth”
than standard lawns meaning less mowing
